Unit 1

1. Introduction to AI

Module 1.1

1.1 Definition of AI and AI Effect

Tutorial 1.1

1.1 Definition of AI and AI Effect

AI-1.1.1 K2 Describe the AI effect and how it influences the definition of AI.

Definition of AI and AI Effect

- The term artificial intelligence (AI) dates back to the 1950s
- AI refers to the objective of building and programming “intelligent” machines capable of imitating human beings

- Definition of AI:
  - The capability of an engineered system to acquire, process and apply knowledge and skills.

What is AI Effect?

- The AI Effect refers to the tendency of people to stop considering a task as “AI” once it’s been successfully solved by a computer
- The changing perception of what constitutes AI is known as the “AI Effect”
- Any AI definition made today is likely to change in the future and may not match to those from the past
- What AI effect means?
  - Moving the goalposts:
    - As AI systems master tasks, like playing chess, recognizing speech, or translating languages. These achievements are no longer seen as “intelligent.”
  - Perception shift:
    - The more AI becomes part of everyday life, the less “magical” or “intelligent” it seems

Examples of the AI Effect

- Optical character recognition (OCR):
  - Once considered AI, now just a standard feature in scanners and apps
- Voice assistants:
  - Google Assistant, Siri and Alexa use complex AI, but many people see them as simple tools
- Recommendation engines:
  - Netflix and Spotify use AI to suggest content, but users rarely think of it as artificial intelligence
- Customer Service:
  - Chatbots use AI but are now considered simple programs

THANK YOU!!!
